O-Rings

O-Rings

Hardness of O-Rings

The hardness of all elastomers is generally expressed in accordance with the internationally accepted scale Shore A.

All figures quoted are subject to a tolerance of +/- 5° and the higher the number the harder the compound. Standard O-Rings are usually available between 60° and 90° with 70° being the standard which will always be supplied in the absence of an alternative being requested.

Ordering

When ordering an O-Ring please state either the size reference number or the internal diameter, followed by the cross-section diameter, and then the type of material and shore hardness required. All dimensions are quoted in mm.

Tolerances

O-Rings are manufactured to close tolerances as defined in BS1806-1989, BS 4518- 1982, ISO 3601/1 and DIN 3771/1 up to and including an internal diameter of 670mm and cross section of 7mm.

The tables below relate to O-Rings manufactured from our standard Nitrile compound and refers to the smaller diameter within the specified range.

With other materials and shore hardness, slight deviations may occur due to the differing shrinkage behaviour of proprietary compounds.
